Getting Started with Power BI Desktop

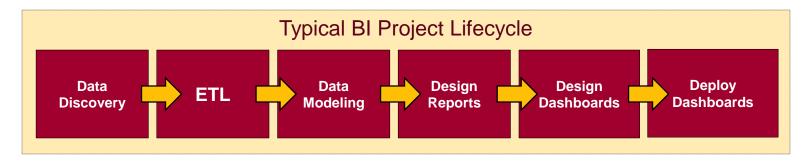

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- Modeling Data in Power BI Desktop
- Designing Reports in Power BI Desktop
- Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

Project Lifecycle for a Custom BI Solution

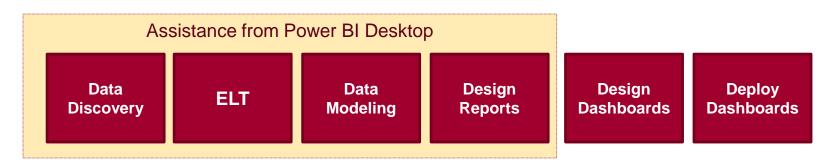

- Lifecycle of a typical BI project includes...
 - Discover where the data lives
 - Extract, transform and load (ETL) data
 - Model data to create dataset for analytics and reporting
 - Design and implement reports on top of dataset
 - Consolidate reports into one or more dashboards
 - Package project artifacts for deployment
 - Deploy to production environment

Working with Power BI Desktop

- Power BI Desktop focuses on first four phases
 - Query features for Data Discovery
 - Query features for ETL
 - Design features and DAX language for data modeling
 - Report design using a visual report designer
 - No support for designing dashboards
 - No support for packaging an entire solution

Installing Power BI Desktop

- Power BI Desktop quick & easy to install over the Internet
 - Select Power BI Desktop option from Power BI Download menu
 - Power BI Desktop downloads & installs in less than a minute

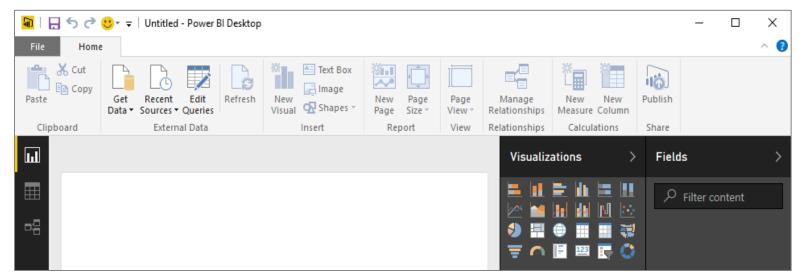

Working with Power BI Desktop

- Power BI Desktop is a Windows application
 - Work is saved and published in terms of projects
 - You can work on multiple projects at once
 - Each project runs in its own Power BI Desktop instance
 - Power BI Desktop can freeze up or act buggy
 - Quit & restart Power BI Desktop if it acts strangely

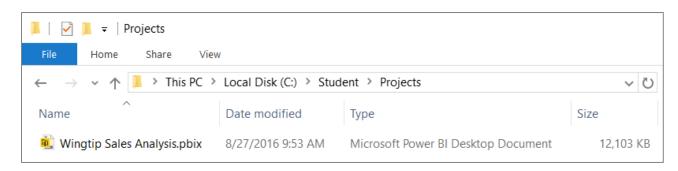

Projects and PBIX Files

- Power BI Desktop projects saved using PBIX files
 - PBIX file contains data source definitions
 - PBIX file contains query definitions
 - PBIX file contains data imported from queries
 - PBIX file contains exactly one data model definition
 - PBIX file contains exactly one report
 - PBIX file never contains data source credentials

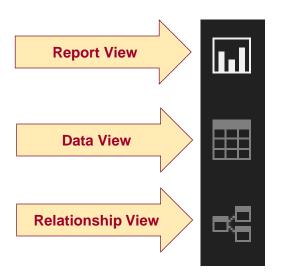

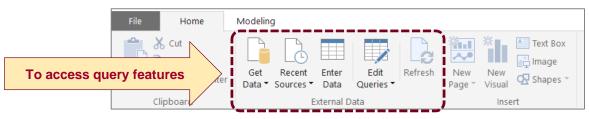

Getting Around in Power BI Desktop

- What do you need to learn to use Power BI Desktop?
 - Query features for importing data
 - Design features for modeling data
 - Report designer for creating reports
- Navigating between view modes

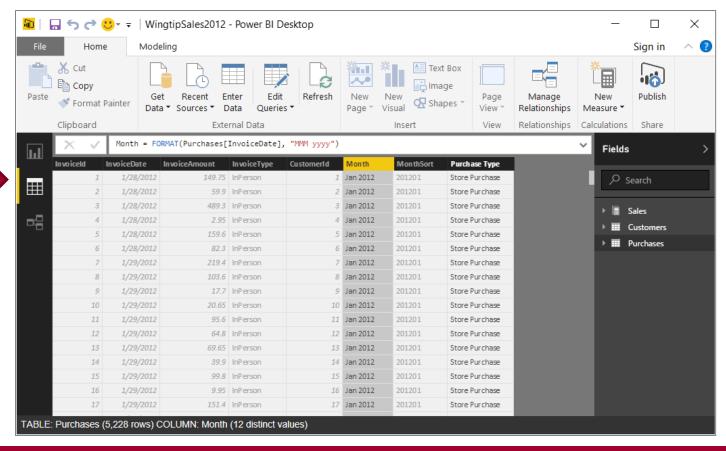

Data View

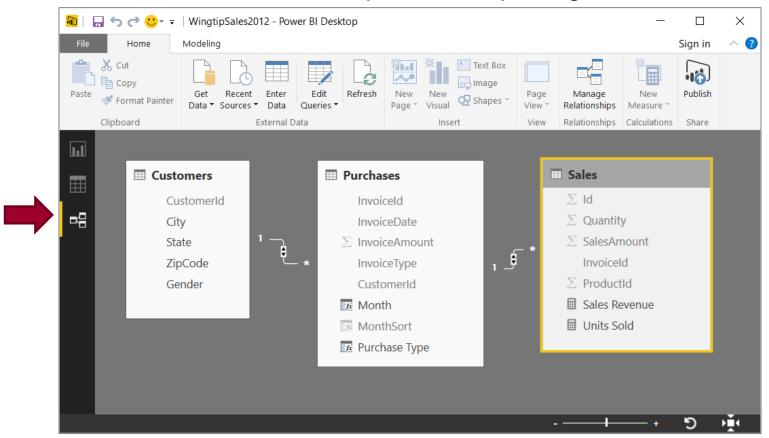

- Data view is used for data modeling
 - Data View displays columns and rows of data for each table
 - Data View used to create calculated columns and measures

Relationship View

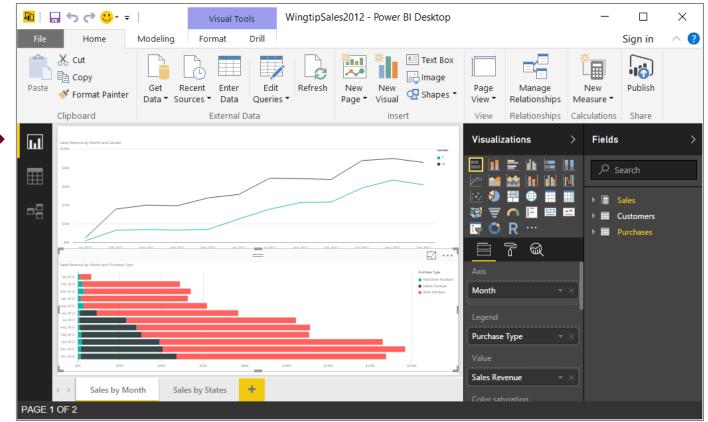

- Displays tables, fields and relationships
 - Used to view tables, fields and relationships in project's dataset
 - Used to create relationships when importing new tables

Report View

- Report view used to design report for current project
 - Report designer is very similar to Power BI service
 - Dataset can be simplified for Report View by hiding fields

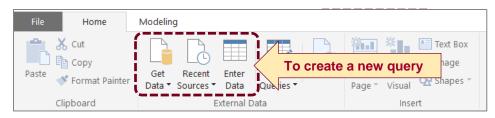

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- Modeling Data in Power BI Desktop
- Designing Reports in Power BI Desktop
- Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

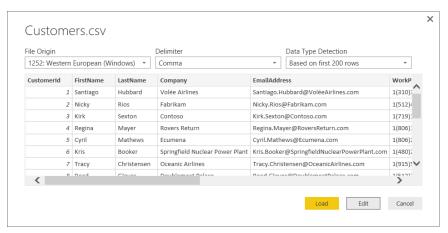

Creating Queries

- Power BI Desktop provides powerful query features
 - Get started by creating a new query

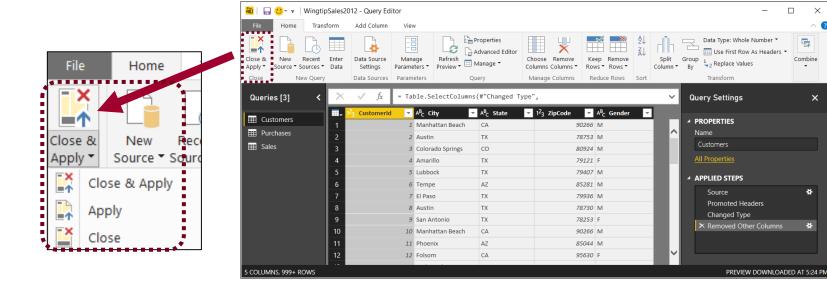

- The difference between Load versus Edit
 - Load command creates and execute new query without editing query
 - Edit command creates new query & opens it in Query Editor window

Query Editor Window

- Power BI Desktop provides separate Query Editor window
 - Provides powerful features for designing queries
 - Displays list of all queries in project on the left
 - Displays **Properties** and **Applied Steps** for selected query on right
 - Preview of table generated by query output shown in the middle
 - Query can be executed using Apply or Close & Apply command

 \times

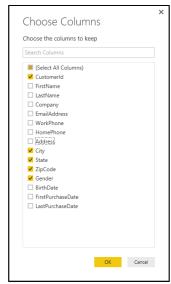

Queries Are Defined as Sequence of Steps

- Here is an example of adding a query step
 - Click a column header then click Choose Column button in ribbon

Query definition is modified by adding new step

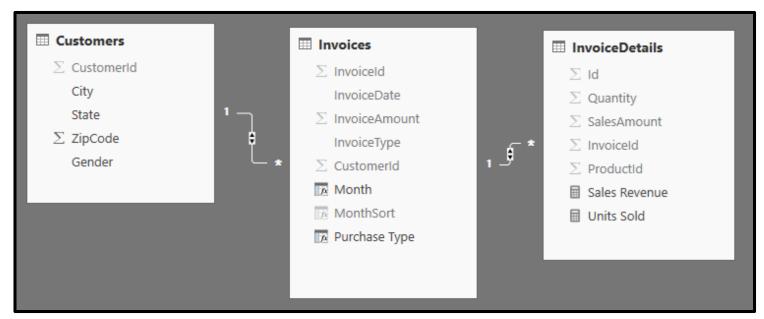

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- Modeling Data in Power BI Desktop
- Designing Reports in Power BI Desktop
- Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

The Project's Data Model

- Each PBIX project defines a data model
 - Data model contains tables, fields and relationships
- Tables contain three different types of fields
 - Native columns
 - Calculated columns
 - Measures

Data Analysis eXpression Language (DAX)

- Calculated columns and measures created using DAX
 - DAX is programming language used by tabular database model
 - Calculated columns and measures created with DAX Expressions

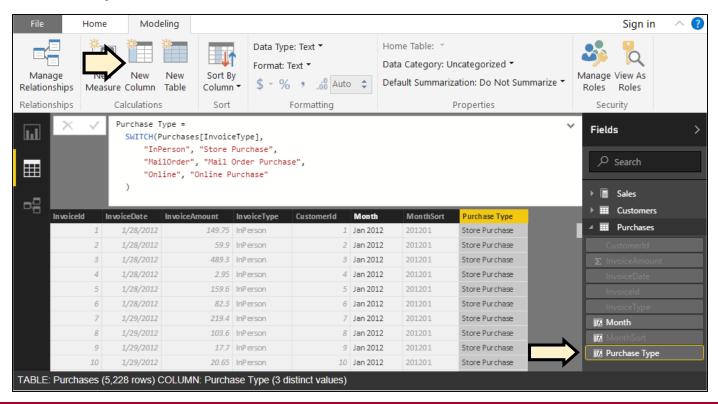

```
=SUM('Sales'[SalesAmount])
```

- DAX expressions are similar to Excel formulas
 - They always start with an equal sign (=)
 - DAX provides many built-in functions just like to Excel
- DAX Expressions are not the same as Excel formulas...
 - DAX expressions cannot reference cells (e.g. A1 or C4)
 - Instead DAX expressions reference columns and tables

Creating Calculated Columns

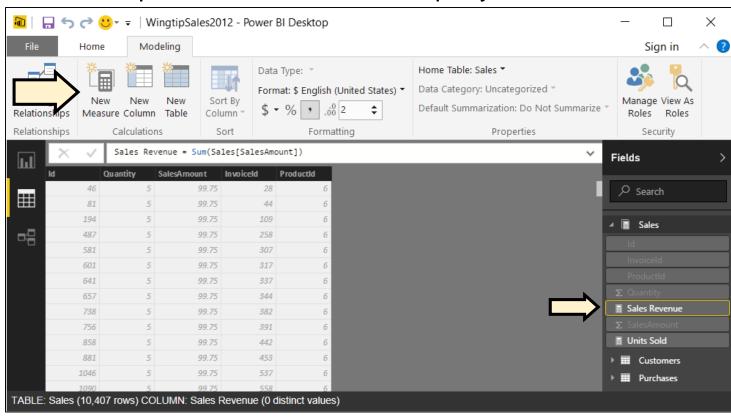

- Calculated column can be added to table
 - Calculated column created by clicking New Column button
 - Calculated column created as named DAX expression
 - DAX expression for calculate column evaluated at table load time

Creating Measures

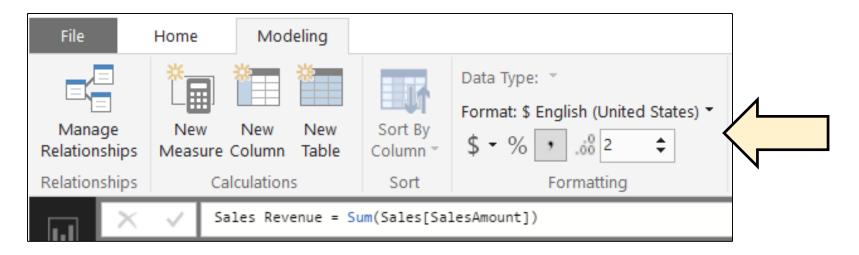

- Measure defined as named DAX expression
 - Measure created by clicking New Measure button in ribbon
 - Measure expression is evaluated at query time

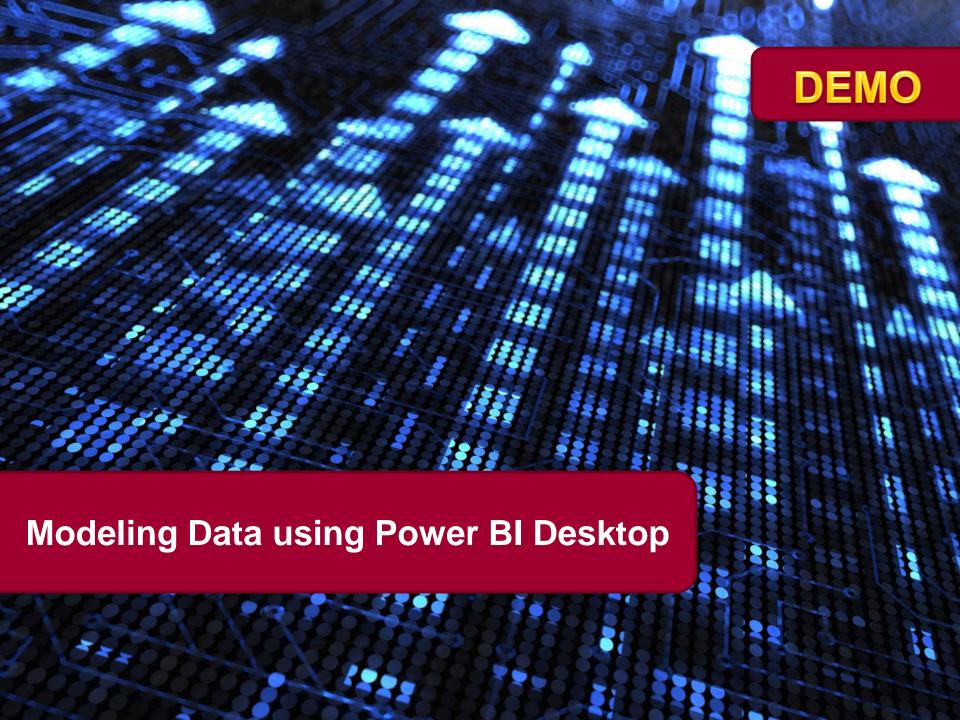

Formatting Columns and Measures

- Each column & measure has formatting properties
 - Make sure you set formatting for columns and measures

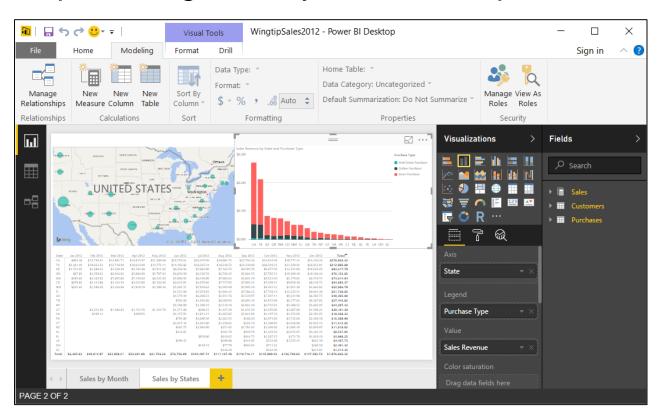

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- ✓ Modeling Data in Power BI Desktop
- Designing Reports in Power BI Desktop
- Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

Designing Reports

- Report View is used to design reports
 - You design reports by adding visuals & configuring them
 - Report design is very similar to experience in browser

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- ✓ Modeling Data in Power BI Desktop
- ✓ Designing Reports in Power BI Desktop
- Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

Publishing a Power BI Desktop Project

- Power BI Desktop provides Publish command
 - Used to publish project to Power BI service

Requires logging into your Office 365 account

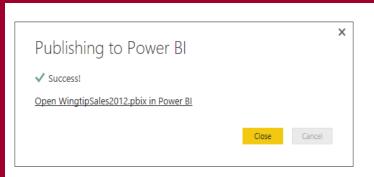

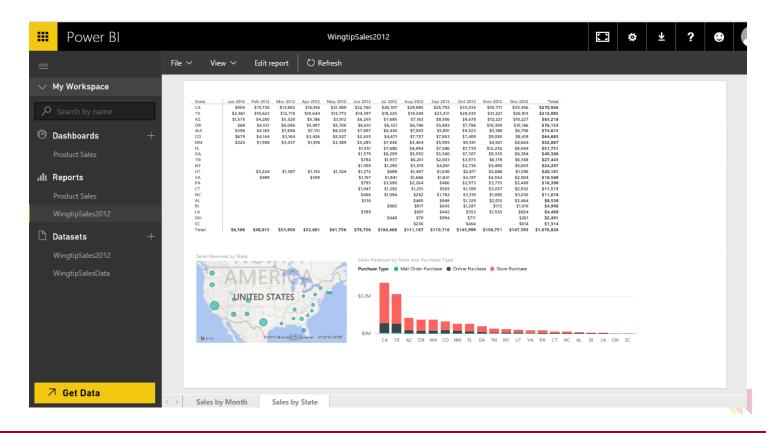

Published articles added to target workspace

A Published Power BI Desktop Project

Agenda

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- ✓ Modeling Data in Power BI Desktop
- ✓ Designing Reports in Power BI Desktop
- ✓ Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files

Query Parameters

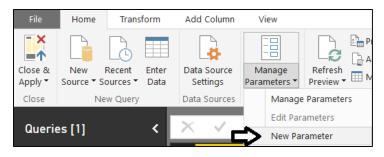

- What is a Query Parameter?
 - Configurable setting with project scope
 - Strongly-typed value to which you can apply restrictions
 - Can be referenced from a query
 - Can be referenced from DAX code in data model

- Where are Parameters commonly used
 - To parameterize data source connection details
 - To filter rows when importing data

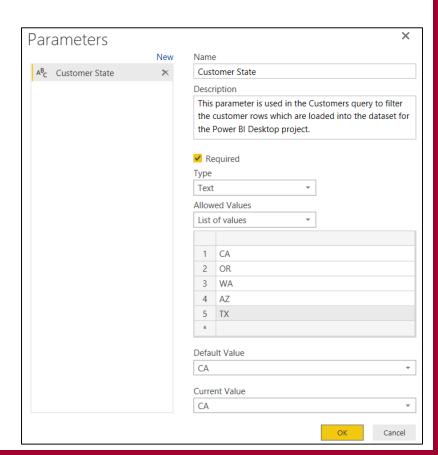

Creating Query Parameters

Parameters can be created using Manager Parameters menu

- Parameter properties
 - Name
 - Description
 - Required
 - Allowed Values
 - Default Value
 - Current Value

Referencing Parameters in a Query

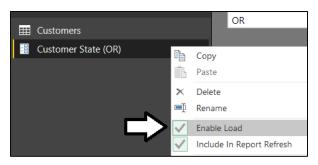

- Parameters can be referenced inside query
 - Next query execution uses current parameter value

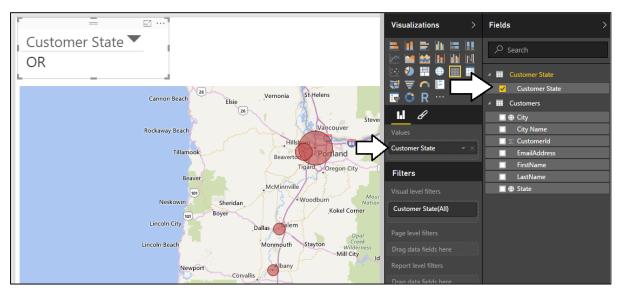

Making Parameters Available to Data Model

Configure parameter's Enable Load setting

Parameter becomes visible within fields list in report view

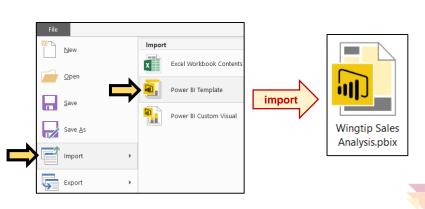

Power BI Project Template Files

- PBIX project can be exported to project template file
 - Template file created with PBIT file extension
 - Generated template files contains everything except for the data
 - PBIT template file can be imported to create new PBIX projects
 - Template files are powerful when used together with parameters
- How are template files used?
 - Export PBIX project to create a PBIT template file
 - Import the PBIT template file to create a new PBIX project

Summary

- Getting Started with Power BI Desktop
- Creating Queries in Power BI Desktop
- ✓ Modeling Data in Power BI Desktop
- ✓ Designing Reports in Power BI Desktop
- ✓ Publishing Power BI Desktop Projects
- Understanding Parameters and Template Files
