Designing a Data Model with Power BI Desktop

Agenda

- Modeling Data in Power BI Desktop
- Understanding Table Relationships
- Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

Data Modeling with Power BI Desktop

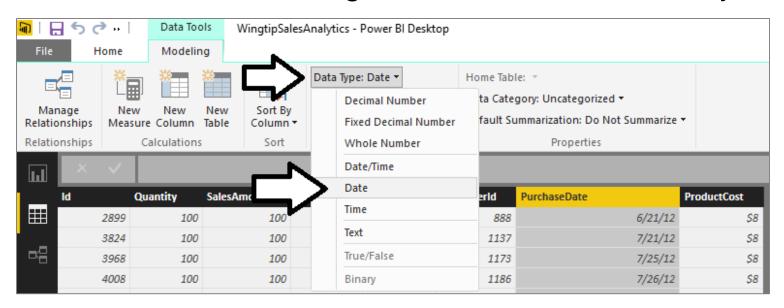

- Steps to create a data model with Power Pivot
 - Create relationships between tables
 - Modify columns (rename, set formatting, convert type)
 - Create calculated columns
 - Create measures
 - Add column metadata
 - Create dimensional hierarchies
 - Add Calendar table(s)

Covered in next module

Converting Column Types

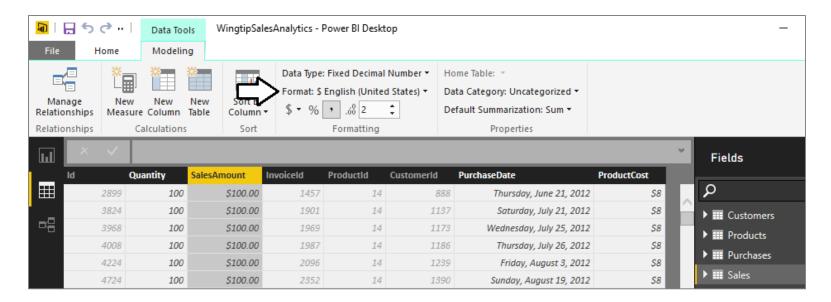

- Power Pivot allows you to convert columns
 - Alternative to converting column with Power Query

Formatting Columns

- Each column has its own formatting properties
 - Formatting propagated to reports and visuals
 - Makes it easier on data model consumers

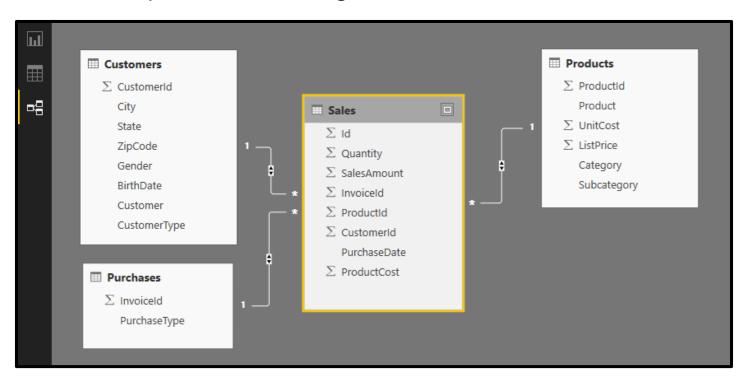

Agenda

- ✓ Modeling Data in Power BI Desktop
- Understanding Table Relationships
- Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

Table Relationships

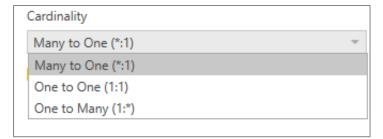

- Tables in data model associated with relationships
 - Relationships based on single columns
 - Tabular model supports [1-to-1] and [1-to-many] relationships
 - Relationships based on single column in each table

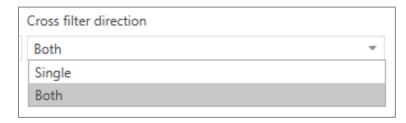

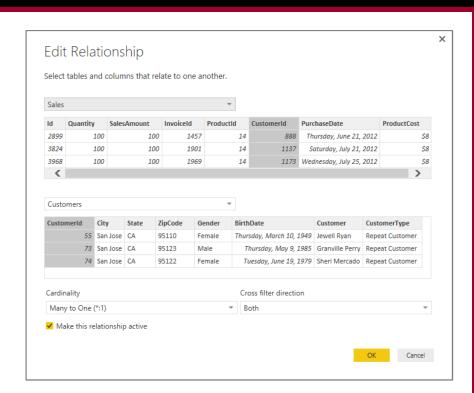

Relationship Properties

Cardinality

Cross filter direction

Agenda

- ✓ Modeling Data in Power BI Desktop
- Understanding Table Relationships
- Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

Working with DAX

- DAX is the language used to create data model
 - DAX stands for "Data Analysis Expression Language"
- DAX expressions are similar to Excel formulas
 - They always start with an equal sign (=)
 - DAX provides many built-in functions similar to Excel
- DAX Expressions are unlike Excel formulas...
 - DAX expressions cannot reference cells (e.g. A1 or C4)
 - Instead DAX expressions reference columns and tables

```
=SUM('Sales'[SalesAmount])
```

Writing DAX Expressions

Some DAX expressions are simple

```
Sales Revenue = Sum(Sales[SalesAmount])
```

Some DAX expressions are far more complex

```
Sales Growth PM = IF(
( ISFILTERED(Calendar[Month]) && ISFILTERED(Calendar[Date]) = FALSE() ),
DIVIDE(
 SUM(Sales[SalesAmount]) -
 CALCULATE(
    SUM(Sales[SalesAmount]),
    PREVIOUSMONTH(Calendar[Date])
  ),
 CALCULATE(
    SUM(Sales[SalesAmount]),
    PREVIOUSMONTH(Calendar[Date])
BLANK()
```

Types of DAX Functions

- Date and Time Functions
- Information Functions
- Logical Functions
- Mathematical and Trigonometric Functions
- Statistical Functions
- Filter Functions
- Text Functions
- Time Intelligence Functions

Calculated Columns vs Measures

- Calculated Columns (aka Columns)
 - Evaluated based on context of a single row
 - Evaluated when data is loaded into memory

```
Column1 = <DAX expression>
```

- Measures
 - Evaluated at query time based on current filter context
 - Commonly used for aggregations (e.g. SUM, AVG, etc.)
 - Used more frequently than calculated columns

```
Measure1 = <DAX expression>
```

Agenda

- ✓ Modeling Data in Power BI Desktop
- ✓ Understanding Table Relationships
- ✓ Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

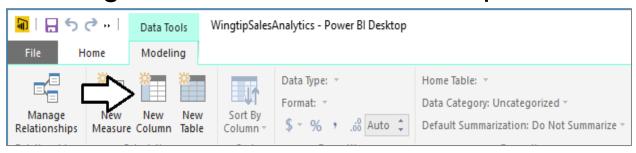

When to Create Calculated Columns

- Measures often better choice than calculate columns
 - Don't create calculated column when you need a measure
 - Prefer to create calculated columns only in specific scenarios
- When should you create calculated columns?
 - To create headers for row labels or column labels.
 - To place calculated results in a slicer for filtering
 - Define an expression strictly bound to current row
 - Categories text or numbers (e.g. customer age groups)

Creating Calculated Columns

- Edited in formula bar of Power Pivot data view
 - Start with name and then equals (=) sign
 - Enter a valid DAX expression
 - Clicking on column adds it into expression

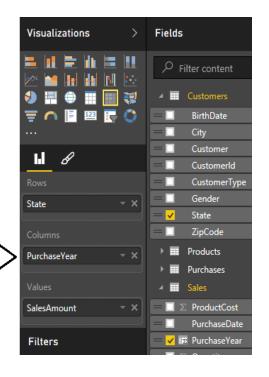

× •	<pre>PurchaseYear = YEAR(Sales[PurchaseDate])</pre>											
ld	Quantity	SalesAmount	Invoiceld	ProductId	CustomerId	PurchaseDate	ProductCost	SalesProfit	PurchaseYear			
2899	100	\$100.00	1457	14	888	6/21/12	\$8.00	\$92.00	2012			
3824	100	\$100.00	1901	14	1137	7/21/12	\$8.00	\$92.00	2012			
3968	100	\$100.00	1969	14	1173	7/25/12	\$8.00	\$92.00	2012			
4008	100	\$100.00	1987	14	1186	7/26/12	\$8.00	\$92.00	2012			
4224	100	\$100.00	2096	14	1239	8/3/12	\$8.00	\$92.00	2012			
4724	100	\$100.00	2352	14	1390	8/19/12	\$8.00	\$92.00	2012			

Calculated Column as a Column Label

- Calculate column can serve as...
 - Row labels
 - Column labels

Г			=			
State	2012	2013	2014	2015	Total	
CA	\$270,926.32	\$550,160.02	\$737,878.53	\$770,402.11	\$2,329,366.98	
TX	\$212,085.08	\$490,643.98	\$683,079.11	\$919,030.36	\$2,304,838.53	
FL	\$51,730.85	\$300,866.87	\$535,693.94	\$891,344.92	\$1,779,636.58	
NC	\$11,018.02	\$164,804.24	\$315,139.92	\$448,638.72	\$939,600.90	
NY	\$24,207.43	\$165,046.23	\$256,294.27	\$430,971.24	\$876,519.17	
GA	\$40,305.80	\$152,807.51	\$239,451.05	\$417,037.28	\$849,601.64	

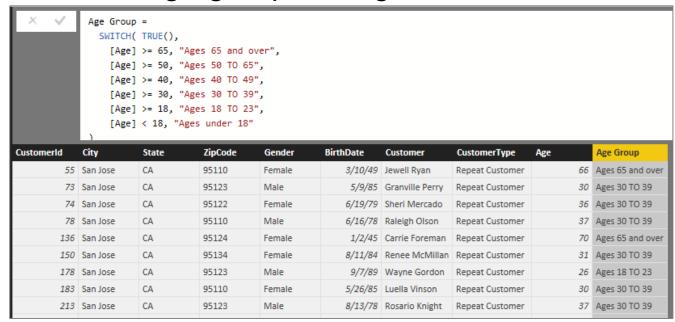

Calculated Column for Customer Age Group

1. Calculate customer age from birthdate

Ш	X								
_	CustomerId	City	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age
	55	San Jose	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66
_	73	San Jose	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30
믁	74	San Jose	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36
	78	San Jose	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37
	136	San Jose	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70
	150	San Jose	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31

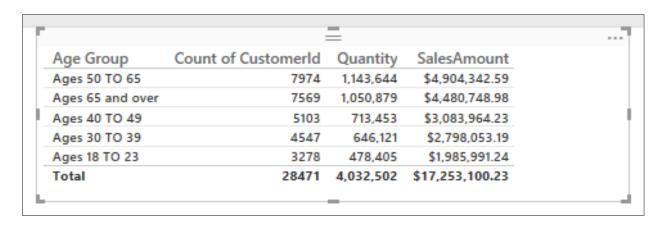

2. Calculate age groups using calculated column

Calculated Column as a Row Label

Age Group can now be used as row label

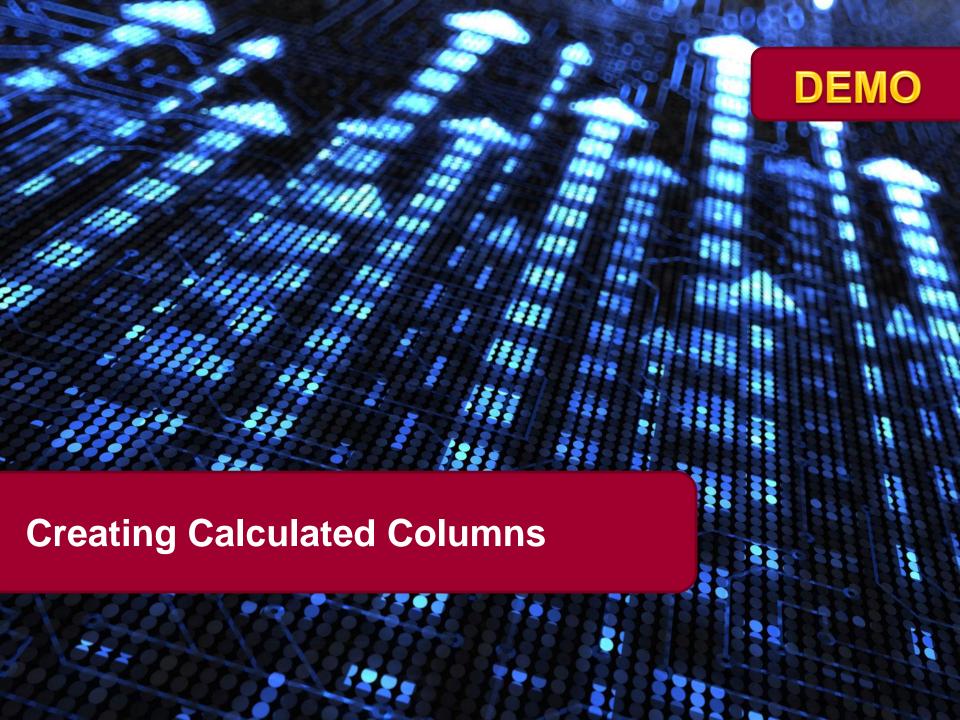

Calculated Column used in a Slicer

Calculated column can populate slicer values

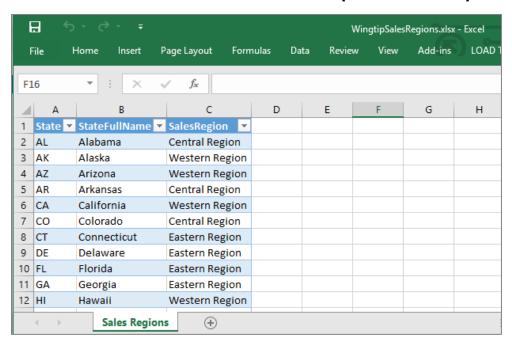

Adding Lookup Tables to the Data Model

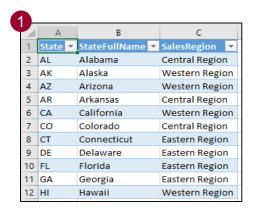

- Data modeling might required adding lookup tables
 - Lookup tables inject extra related data into data model
- Example: Sales Regions table
 - Assign each state to specific sales region
 - Include full state name it required in reporting

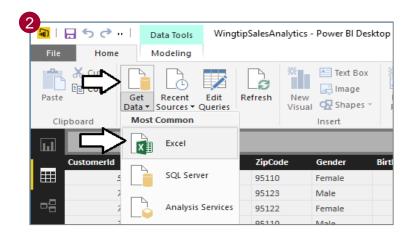

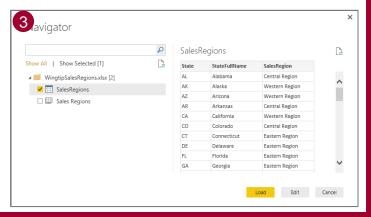

Importing the SalesRegions Table from Excel

Import table from Excel using Power Query

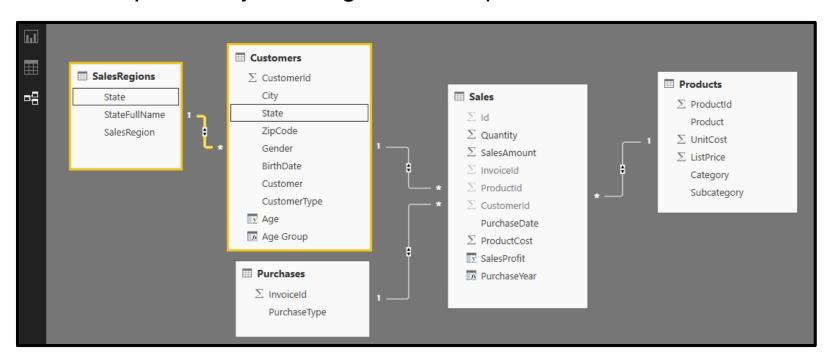

Integrating the Lookup Table into the Data Model

- Lookup table must be integrated into data model
 - Accomplished by creating relationship to one or more tables

The RELATED Function

- RELATED function performs cross-table lookup
 - Effectively replaces older VLOOKUP function
 - Used in many-side table to look up value from one-side
 - Used to pull data from lookup table into primary table

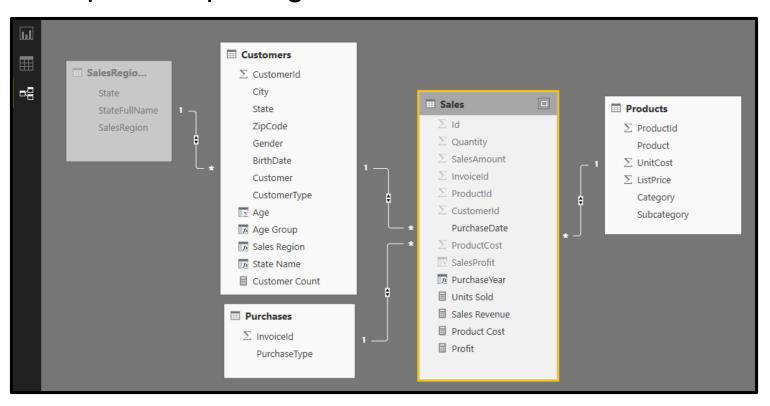

Ш	X ✓ Sales Region = RELATED(SalesRegions[SalesRegion])										
	CustomerId	City	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age	Age Group	Sales Region
	55	San Jose	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66	Ages 65 and over	Western Region
	73	San Jose	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30	Ages 30 TO 39	Western Region
唱	74	San Jose	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36	Ages 30 TO 39	Western Region
	78	San Jose	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37	Ages 30 TO 39	Western Region
	136	San Jose	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70	Ages 65 and over	Western Region
	150	San Jose	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31	Ages 30 TO 39	Western Region

ш	× ✓	State Name = RELATED(SalesRegions[StateFullName])									
	State	ZipCode	Gender	BirthDate	Customer	CustomerType	Age	Age Group	Sales Region	State Name	
	CA	95110	Female	3/10/49	Jewell Ryan	Repeat Customer	66	Ages 65 and over	Western Region	California	
	CA	95123	Male	5/9/85	Granville Perry	Repeat Customer	30	Ages 30 TO 39	Western Region	California	
唱	CA	95122	Female	6/19/79	Sheri Mercado	Repeat Customer	36	Ages 30 TO 39	Western Region	California	
	CA	95110	Male	6/16/78	Raleigh Olson	Repeat Customer	37	Ages 30 TO 39	Western Region	California	
	CA	95124	Female	1/2/45	Carrie Foreman	Repeat Customer	70	Ages 65 and over	Western Region	California	
	CA	95134	Female	8/11/84	Renee McMillan	Repeat Customer	31	Ages 30 TO 39	Western Region	California	

Hiding the Lookup Table

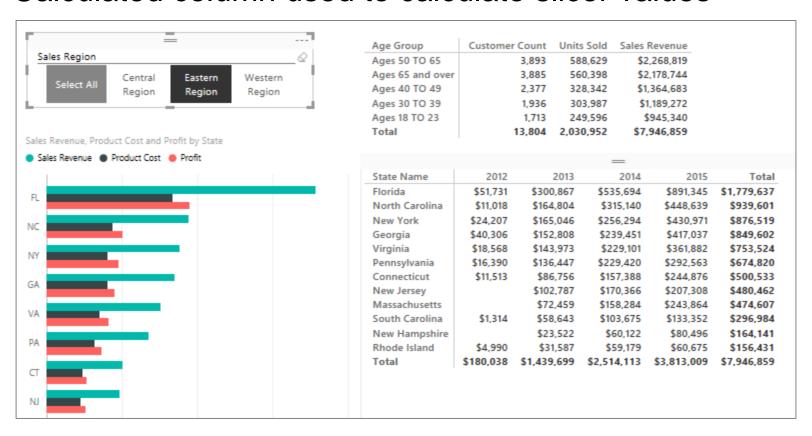

- Lookup table can often be hidden
 - simplifies reporting for data model consumers

Filtering on Sales Region

Calculated column used to calculate slicer values

Agenda

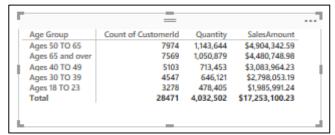

- ✓ Modeling Data in Power BI Desktop
- ✓ Understanding Table Relationships
- ✓ Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

Benefits of Measures over Calculated Columns

- Calculated columns can be aggregated in visual
 - However, aggregation details are stored in visual
 - Visual doesn't offer control over name and formatting

- Measure defines name, aggregation and formatting
 - Work is done once and reused across many visuals
 - Makes data model more fool-proof for report designers

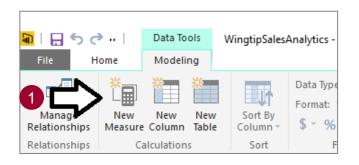

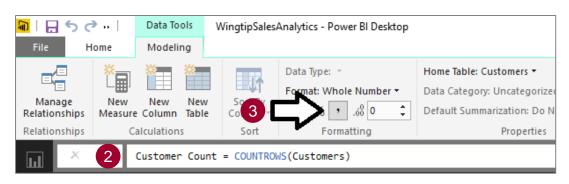

Age Group	Customer Count	Units Sold	Sales Revenue	
Ages 50 TO 65	7,974	1,143,644	\$4,904,343	
Ages 65 and over	7,569	1,050,879	\$4,480,749	
Ages 40 TO 49	5,103	713,453	\$3,083,964	
Ages 30 TO 39	4,547	646,121	\$2,798,053	
Ages 18 TO 23	3,278	478,405	\$1,985,991	
Total	28,471	4,032,502	\$17,253,100	

Creating Measures

- Measures have advantage over calculated columns
 - They are evaluated based on the current evaluation context
- Creating a measure with Power BI Desktop
 - Click New Measure button
 - 2. Give measure a name and write DAX expressions
 - 3. Configure formatting

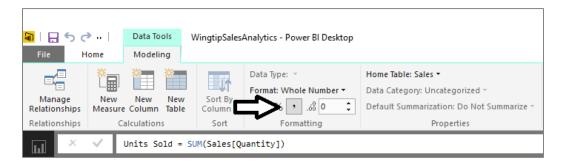

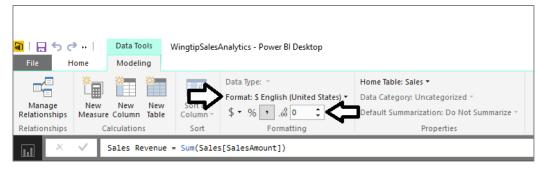

Formatting Measures

Format as whole number

Format as currency

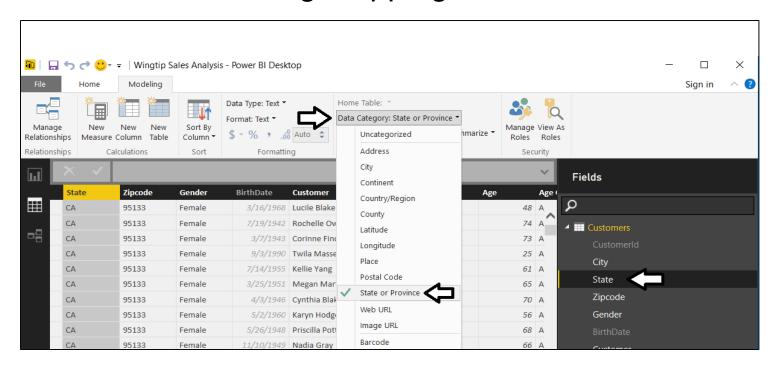

Agenda

- ✓ Modeling Data in Power BI Desktop
- ✓ Understanding Table Relationships
- ✓ Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model

Geographic Field Metadata

- Fields in data model have metadata properties
 - Metadata used by visuals and reporting tools
 - Used as hints to Bing Mapping service

Eliminate Geographic Ambiguity

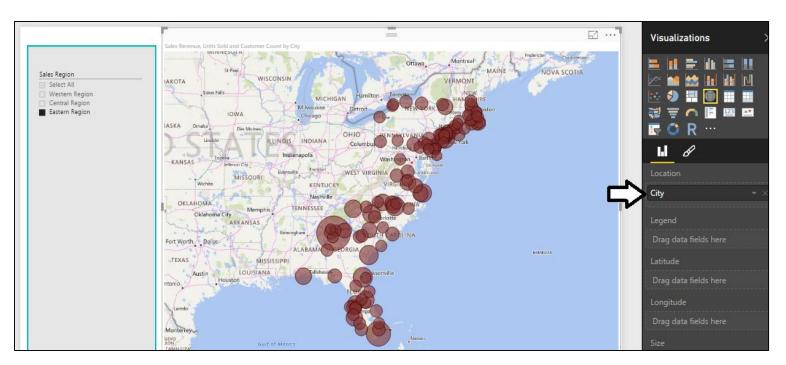

- City name alone is ambiguous
 - "Athens" defaults to Greece not Georgia
 - Concatenate city name with state to disambiguate

>	City = [City Name] & ", " & [State]								
	Age Group	Sales Region	State Name	SalesRegionSort	City				
48	Ages 40 TO 49	Western Region	California	1	San Jose, CA				
74	Ages 65 and over	Western Region	California	1	San Jose, CA				
73	Ages 65 and over	Western Region	California	1	San Jose, CA				
25	Ages 18 TO 23	Western Region	California	1	San Jose, CA				
61	Ages 50 TO 65	Western Region	California	1	San Jose, CA				
65	Ages 65 and over	Western Region	California	1	San Jose, CA				

Using Map Visual with a Geographic Field

- Map Visual shows distribution over geographic area
 - Visual automatically updates when filtered

Summary

- ✓ Modeling Data in Power BI Desktop
- ✓ Understanding Table Relationships
- ✓ Writing DAX Expressions
- Creating Calculated Columns
- Creating Measures to Aggregate Data
- Adding Geographic Fields to a Data Model
